

COURSE DESCRIPTION – ACADEMIC YEAR 2017/2018

Course title	Principles of Computation
Course code	74017
Scientific sector	ING-INF/05
Degree	European Master's Program in Computational Logic (LM-18)
Semester	1
Year	2
Credits	12
Modular	Yes
University	UniBZ
Total lecturing hours	48
Total lab hours	24
Total exercise hours	--
Attendance	Not compulsory
Prerequisites	There are no prerequisites in terms of courses to attend. Students should be familiar with notions of mathematics and set theory, and with basic proof techniques, as taught in the mathematics courses of a bachelor in computer science.
Course page	To be announced
Specific educational objectives	<p>The course belongs to the type "A scelta della/o studente". The course is part of the advanced topics offered within the degree and can be selected by the student as one of the three which must be completed according to the study plan.</p> <p>This course deals with the theoretical foundations of computation. It aims at getting acquaintance with abstract, mathematical models of computation, and the use of such models for assessing the ability to solve computational problems, by identifying both the intrinsic limitations of computing devices, and the practical limitations due to limited availability of resources.</p> <p>To this end the course covers in its core theory of computability including models of computation, computable functions, recursion theory, limits of solvability, as well as computational complexity theory, including complexity measures, complexity classes, problem reduction and completeness. Topical aspects (e.g., emerging models of computation, applications in computational logic, or advanced algorithmic techniques) allow to gain additional knowledge and skills. The main objective is that after completing this course, the students have a deep understanding of the theoretical foundations and the limits of computation. They also have a solid knowledge of complexity theory, which they can apply to establish complexity bounds and characterizations of computational problems in applications, and to develop algorithms for the solution of such problems. A further objective is that the students are able to reason and prove properties about computations in a precise, formal, abstract way.</p>
Module 1	Theory of Computing
Module code	74017A
Module scientific sector	ING-INF/05
Lecturer	Diego Calvanese
Contact	Piazza Domenicani 3 , Room 2.07, calvanese@inf.unibz.it , 0471-016160

Scientific sector of lecturer	ING-INF/05
Teaching language	English
Office hours	By appointment via mail.
Lecturing assistant (if any)	--
Office hours LA	--
Credits	8
Lecturing hours	48
Lab hours	--
Exercise hours	24
List of topics	<ul style="list-style-type: none"> • Formal languages • Formal grammars • Turing Machines • Recursive functions • Undecidability • Computational complexity • NP-completeness • Time and space complexity classes
Teaching format	Frontal lectures.

Module 2	Research Project in Foundations of Knowledge Representation Languages
Module code	74017B
Module scientific sector	ING-INF/05
Lecturer	Marco Montali
Contact	Piazza Domenicani 3 , Room 2.07, marco.montali@unibz.it, 0471-016116
Scientific sector of lecturer	ING-INF/05
Teaching language	English
Office hours	By appointment via mail.
Lecturing assistant (if any)	--
Office hours LA	--
Credits	4
Lecturing hours	--
Lab hours	--
Exercise hours	--
List of topics	<p>The student will further investigate a specific topic covered by the first module.</p> <p>The selection of the topic and the research activity shall be carried out under the supervision of a tutor selected in agreement with the lecturer of the first module.</p>
Teaching format	Supervised project activities.

Learning outcomes	<p>Knowledge and understanding:</p> <ul style="list-style-type: none"> • Thoroughly understand the scientific method of investigation. • Understand the methods of mathematics and statistics which are of support to information technology and its applications. <p>Applying knowledge and understanding:</p> <ul style="list-style-type: none"> • Be able to extend or modify a formal calculation model in an original way, taking into account altered conditions or requirements.
--------------------------	--

	<ul style="list-style-type: none"> • Be able to define an algorithmic solution to a computational problem and to estimate its complexity. <p>Ability to make judgments</p> <ul style="list-style-type: none"> • Be able to identify reasonable work goals and estimate the resources required to achieve the objectives. <p>Communication skills</p> <ul style="list-style-type: none"> • Ability to structure and write technical reports concerning project activities. <p>Ability to learn</p> <ul style="list-style-type: none"> • Be able to autonomously extend the knowledge acquired during the study course by reading and understanding scientific and technical documentation mostly in English. • Be able, in the context of a problem-solving activity, to extend even incomplete knowledge taking into account the objective of the project.
<p>Assessment</p>	<p>The assessment of the course consists of different parts:</p> <ul style="list-style-type: none"> • midterm or final exam on the first half of the syllabus (35%) – covered in M1; • final exam on the second half of the syllabus (35%) – covered in M1; • evaluation of the project activities (30%) – covered in M2. <p>Each part of the examination may be either written or oral.</p>
<p>Assessment language</p>	<p>English</p>
<p>Evaluation criteria and criteria for awarding marks</p>	<p>At the exam, the student has to solve exercises and answer questions on the course topics in written or oral form. The solution of the exercises requires the ability to apply the notions and techniques studied in the course to novel contexts.</p> <p>The two parts of the examination can be taken independently of each other within the three exam sessions of an academic year. In case of a positive mark for one of the two parts (obtained at the midterm or at one of the first two regular exam sessions), that part will count for all 3 regular exam sessions.</p> <p>The main criteria for the assessment of the project work are:</p> <ul style="list-style-type: none"> • original contribution of the student • quality of presentation • technical quality of the work • quality of the report
<p>Required readings</p>	<ul style="list-style-type: none"> • Introduction to Automata Theory, Languages, and Computation (3rd edition). J.E. Hopcroft, R. Motwani, J.D. Ullman. Addison Wesley, 2007. Unibz Library location: ST 130 H791(3.07) • Languages and Machines (3rd edition). Thomas A. Sudkamp. Addison Wesley, 2005. Only Chapter 13 (available on the course webpage).
<p>Supplementary readings</p>	<ul style="list-style-type: none"> • Elements of the Theory of Computation (2nd edition). H.R Lewis, C.H. Papadimitriou. Prentice Hall. 1998. • Introduction to the Theory of Computation. M. Sipser. PWS Publishing Company. 1997. • Complexity Theory. Ingo Wegener. Springer, 2005.

- Computational Complexity. C.H. Papadimitriou. Addison Wesley, 1995.
