

Syllabus

Course description

Course title	Quality Management
Course code	47501
Scientific sector	ING-IND/16
Degree	Master in Industrial Mechanical Engineering
Semester	1
Year	/
Academic year	2018/19
Credits	5
Modular	<i>no</i>

Total lecturing hours	28 hrs
Total lab hours	
Total exercise hours	18 hrs
Attendance	Extremely recommended
Prerequisites	none
Course page	https://www.unibz.it/en/faculties/sciencetechnology/master-industrial-mechanical-engineering/

Specific educational objectives	<p>The course belongs to the general courses of the Master Industrial Mechanical Engineering. It aims at teaching both scientific foundations and practical applications of quality management methods.</p> <p>The lecture Quality Management provides the basics in quality management methods in various applications such as product development, production planning and production as well as the introduction of quality management systems (QMS). In the context of quality management methods, a special focus is on production-oriented statistical quality control methods (e.g. process capability, statistical process control). The use of statistical applications in the industrial environment is treated by means of exercises and practical case studies in the computer lab.</p>
--	---

Lecturer	Prof. Elisabetta Ceretti Prof. Aldo Attanasio
Scientific sector of the lecturer	ING-IND/16
Teaching language	English
Office hours	By appointment
Teaching assistant (if any)	None
List of topics covered	<p>The course covers the following topics:</p> <ol style="list-style-type: none"> 1) Introduction to quality and quality management (e.g. evolution of quality thinking, TQM)

	<ol style="list-style-type: none"> 2) Quality management methods for problem solving (e.g. elementary QM methods, problem solving process). 3) Quality management in product planning (e.g. VOC, QFD) 4) Quality management in product development (e.g. FTA, FMEA, Poka Yoke) 5) Quality management in production planning (e.g. DoE, digital factory) 6) Quality management in production (statistical quality control methods: e.g. basics, distributions, process capability, SPC) 7) Quality management in application phase (e.g. reliability analysis) 8) Quality management systems (e.g. ISO 9000 ff., auditing, certifications)
<p>Teaching format</p>	<p><i>The topics are presented by the professor by means of Power Point presentations or the blackboard.</i></p> <p><i>A selection of the material presented in class as well as online resources and useful material will be available in the course reserve collection database.</i></p> <p><i>Further deepening material will be supplied or recommended by the teacher.</i></p>
<p>Learning outcomes</p>	<p><u>Knowledge and understanding</u> The student knows the basics of quality management, the current methods and tools for statistical quality control and normative rules for the introduction of QMS.</p> <p><u>Applying knowledge and understanding</u> The student applies and practices theoretical contents through exercises and case studies. Theory contents are practiced through exercises using practical examples from industrial environment. The students have to solve given problems through the learned instruments and statistical approaches.</p> <p><u>Making judgements</u> Depending on the application or the problem, the student can judge the use of appropriate methods, models and systems for quality management. He is also able to judge and interpret results from statistical quality control (quality control charts, process capability parameters) and to define measures for optimization of quality.</p> <p><u>Communication skills</u> The student can make professional discussions on quality management techniques and tools and is able to structure, present and argue professional content through</p>

	<p>analog (flipchart) and digital (PowerPoint, Excel) media.</p> <p><u>Learning skills</u> The student learns both by frontal teaching (theory part) as well as by exercises and presentations. The student is able to enlarge his knowledge through self-study and consultation of scientific and technical texts.</p>
Assessment	<p>Formative assessment <i>In class and laboratory exercises and activities (2,3,4,5)</i></p> <p>Summative assessment <i>The assessment of the course is:</i></p> <ul style="list-style-type: none"> • <i>Written exam.</i> <p><i>Written exam with exercises and questions to test the ability to use and transfer the acquired knowledge as well as to make judgement and use a proper technical language (1,2,3,4,5).</i></p>
Assessment language	English
Evaluation criteria and criteria for awarding marks	<p>The final mark will be obtained by the evaluation of the final written test.</p> <ul style="list-style-type: none"> ▪ Relevant for assessment : clarity of answers, mastery of language (also with respect to teaching language), ability to summarize, evaluate, and establish relationships between topics, skills in critical thinking, ability to summarize and make judgments.
Required readings	Lecture notes and documents for exercise will be available on the reserve collections
Supplementary readings	Books and articles will be suggested by the teacher during the course
