Syllabus
Course description

Course title	Fundamentals of Machinery and Oleodynamic
Course code	42151
Scientific sector	ING-IND/08
Degree	Bachelor in Industrial and Mechanical Engineering
Semester	1st
Year	III
Credits	8
Modular	No

Total lecturing hours	50
Total lab hours	0
Total exercise hours	30
Attendance	Not mandatory, but strongly advisable
Recommended preliminary knowledge	Engineering Thermodynamics, Heat and Mass Transfer and Fluid Mechanics
Course page	

Specific educational objectives	The Fundamentals of Machinery and Oleodynamic course is a core teaching in the context of the degree in Industrial and Mechanical Engineering and specifically it deals with the operative and design aspects of fluid machines that are used for the conversion of energy (production and use). The course consists of 50 hours of frontal lectures and 30 hours of exercises. The lectures introduce the fundamental concepts and the working principles of the fluid machines using both compressible and non-compressible fluids. The main mechanical and energy conservation principles and equations will be described and applied to fluid machines. Specific procedures for the fluid-dynamic design of fluid machines will be presented. In particular, the following topics will be addressed: constructive aspects, behavior of fluids in the fluid machines components, blades and duct design, work exchange mechanisms and thermo-fluid-dynamic transformations in fluid machines, evaluation of the performance. The exercises consist in developing the design procedures of fluid machines and the introduction of such machines in plants and circuits with the aim to give the students a deeper comprehension and understanding of the topics.

Lecturer	Prof. Massimiliano Renzi, K0.05, Massimiliano.renzi@unibz.it 0471- 017816.
Scientific sector of the	ING-IND/08

lecturer	
Teaching language	English
Office hours	Wednesdays, from 18:00 to 20:00. On appointment by e-mail or after the lectures.
List of topics covered	The course will cover the following topics: 1. Introduction and reference of fluid dynamics: definition of fluid machines; basics of aerodynamics of airfoils and hydrofoils for turbo-machines; conservation equations for real flows in fluid machines' systems and their application to thermal and hydraulic machines; velocity triangles and Eulerian work; fluid transformations in turbomachinery vanes; similarity laws applied to fluid machines; 2. Centrifugal, mixed flow and axial pumps: flow rate and head; efficiency; pump impeller design; cavitation; NPSH; coupling with hydraulic circuits 3. Hydraulic turbines: Pelton, Francis, Kaplan; constructive aspects; specific speed; turbine wheel or impeller design; cavitation; 4. Gas and vapour turbines: nozzles and diffusers; isentropic and polytropic efficiencies; turbine blades; impulse and reaction turbine; one-dimensional analysis of the flow; design process and calculation of stage performance 5. Alternative and rotary gas compressors: working principles and working cycle; basic design solutions and performance
Teaching format	The course consists of classroom lectures in which the topics are presented by the lecturer. Design exercises are also foreseen to supply practical examples of the application of the theoretical topics. Course topics will be presented through presentations. Teaching material will be given to the students; additional material will be provided by the Professor.
Professional applications of the covered topics	The contents of this module will be useful for all the professional tasks, in the industry or in the public sector, related to the use of fluid machines and power plants in energy conversion process. Typical jobs can be related to the design and the installation of pumps, hydro- gas- and steam-turbines, and the application of fluid power machines. These competences are necessary in the companies designing, managing and maintaining fluid machines and power plants, in industrial processes, in utilities' companies and in the industries designing components and solutions for the energy conversion.

Learning outcomes	**Intended Learning Outcomes (ILO)** Knowledge and understanding

	Through the application of the principles of thermo-fluid-dynamics to fluid machines, students should be able: 1. To know and understand the fundamental mechanical components used in the fluid machines and their operative function 2. To know and understand the fluid-dynamics of the fluid machines, the design of the fluid-machines components and the introduction of the fluid machines within the industrial and civil plants and devices <u>Applying knowledge and understanding</u> 3. to apply the fluid-dynamic laws to the design of thermal and hydraulic machines' components 4. to apply the studied fluid-machines to industrial and civil plants and devices <u>Making judgements</u> 5. to make autonomous judgements in the choice of the design solutions, of the suitable machines and of the plant solutions in relation to their applications <u>Communication skills</u> 6. to correctly and properly present the concepts acquired in the course both in written and oral form 7. to use the proper technical terms to describe the design solutions of the fluid machines <u>Ability to learn</u> 8. to acquire lifelong learning skills in the field of fluid machines by applying the methods and the concepts acquired in the course
Assessment	Examination of the course is conducted via a written exam. The written exam consists of two parts: i) an exercise on the basic design of one of fluid machines presented during the course to assess the ability of the student to apply the topics of the course in practical applications, the comprehension of the theoretical concepts and the ability to make judgments; ii) at least two open written questions to assess the knowledge and understanding of the course topics, the theoretical aspects, as well as the ability to transfer these skills to case studies of fluid machines. The student can choose to have an additional optional oral exam to further assess his/her preparation. **Formative assessment** **Form** | **Length /duration** | **ILOs assessed** In class | 30 X 60 minutes | 2, 3, 4, 5

	exercises | |

Summative assessment

Form	%	Length /duration	ILOs assessed
Written exam – exercises	50%	1 exercise (1.5 hours)	2, 3, 4, 5
Written exam – theory	50%	2 open-ended questions (1 hour)	1, 2, 6, 7
Oral (optional)	-	2 open-question	1, 2, 6, 7

Assessment language	English
Evaluation criteria and criteria for awarding marks	Students regularly enrolled at the 3nd year of the Bachelor in Industrial and Mechanical Engineering are eligible for the attendance of the lessons and the exam. Other exceptional cases have to be discussed with the Professor. **Written exam - exercise** The written exam assesses the ability of the student to apply the topics of the course in a practical dimensioning exercise and the ability to make judgments. The following criteria will be taken into account: - Correctness of the design choices - Correctness of the dimensioning procedure - Correctness of the numerical solution - Appropriate use of measurement units **Written exam – theory** (open-end question) The written exam on the theory assesses the knowledge and understanding of the course topics, the knowledge of the fluid-dynamic behavior of compressible and incompressible fluids in the components of the fluid machines, as well as the ability to transfer these skills to case studies and to make judgment. The following criteria will be taken into account: - Theoretical knowledge - Ability to provide examples/applications of the theoretical concepts - Communication skills and master of the technical language **Oral exam (optional)** The following criteria will be taken into account: - Theoretical knowledge - Ability to provide examples/applications of the

	theoretical concepts - Communication skills and master of the technical language The exam will be weighted as follows: written (50%), oral (50%). It will not be possible to pass the exam if the exercise or the questions will not have a sufficient mark singularly.

Required readings	Slides presented during the lecture (available in the reserve collection); additional material supplied by the lecturer (typically available in the reserve collection).
Supplementary readings	• S. Sandrolini, G. Naldi, "Macchine, Vol. 1: Fluidodinamica e termodinamica delle turbomacchine", Pitagora Editrice • S. Sandrolini, G. Naldi, "Macchine, Vol. 2: Le turbomacchine motrici e operatrici", Pitagora Editrice • R. Della Volpe, Macchine, Editore Liguori, Napoli • G. Minelli, "Macchine idrauliche", Pitagora Editrice • R. Della Volpe, Esercizi di macchine, Editore Liguori, Napoli
