

COURSE DESCRIPTION – ACADEMIC YEAR 2021/2022

Parallel Computing
76085
INF/01
Master in Software Engineering for Information Systems (LM-18)
1
1
6
No
20
40
Attendance is not compulsory, but strongly recommended.
Students who are unable to follow all lectures and labs are encouraged
to interact with the lecturer.
Good knowledge of the following subjects is expected:
Programming
Computer Systems
Algorithms and Data Structures
https://ole.unibz.it/
The course belongs to the type caratterizzanti – discipline informatiche – Specialization topics
Students will acquire a deep knowledge of how to design faster and efficient applications by exploiting modern parallel architectures (e.g., GPUs).
Under such a light, students will acquire professional skills and knowledge in parallel computing by understanding the most advanced
techniques that researchers have developed in the last years.

Scientific sector of lecturer	INF/01
Teaching language	English
Office hours	Arrange beforehand by email
Lecturing Assistant (if any)	
Contact LA	
Office hours LA	
List of topics	 Introduction to architectures for parallel and distributed systems Shared memory model and GPU Computing Distributed memory model: introduction to Message Passing Interface Principle and design of parallel algorithms Selection of parallel algorithms Performance Analysis, optimizations, and tuning
Teaching format	Frontal lectures

Freie Universität Bozen Libera Università di Bolzano Università Liedia de Bulsan

лг

	• Lab supported by the lecturer and Teaching Assistant (if any)
pr via	the lectures, new concepts and techniques are introduced by esentation on the blackboard and multimedia material (slides and deos). the labs, students will: 1. use the tools that will be used during the course and project
	development;2. solve simple exercise and discuss the solution;3. start to prepare the final project;
su	pported by the lecturer or Teaching Assistant (if any).
D1 arv en	nowledge and understanding: 1.2 To be able to analyse and solve even complex problems in the ea of Software Engineering for Information Systems with particular nphasis on the use of studies, methods, techniques and technologies empirical evaluation;
to	1.3 To know in depth the scientific method of investigation applied complex systems and innovative technologies that support formation technology and its applications;
dc	1.8 To be able to read and understand specialist scientific ocumentation, such as conference proceedings, articles in scientific urnals, technical manuals.
D2 IC	pplying knowledge and understanding: 2.1 To know how to apply the fundamentals of empirical analysis of T data to the construction of mathematical models for the evaluation of prediction of characteristics of applications and software systems;
inf be	2.2 To be able to design and perform experimental analyses of formation systems in order to acquire measures related to their shaviour and to evaluate experimental hypotheses in different fields application, such as business, industrial or research;
te	2.5 To be able to extend and modify in an original way an existing chnical solution or a formal model taking into account changed inditions, requirements and evolution of the technology.
D3 of sc	aking judgments: 3.1 To be able to autonomously select documentation from a variety sources, including technical books, digital libraries, technical ientific journals, web portals or open source software and hardware ols;
	3.4 To be able to reconcile the objectives of the project that are in nflict, to trade-off cost, resources, time, knowledge or risk;
	3.5 To be able to work with large autonomy, also assuming sponsibility for projects and structures.
	ommunication skills:

Freie Universität Bozen Libera Università di Bolzano Università Liedia de Bulsan

	D4.2 To be able to present the contents of a scientific/technical report to an audience, including non-specialists, at a fixed time;
	D4.3 To be able to structure and draft scientific and technical documentation describing project activities;
	D4.4 To be able to coordinate project teams and to identify activities to achieve project objectives;
	D4.5 To be able to prepare and conduct technical presentations in English;
	D4.7 To be able to carry out research and projects in collaborative manner;
	D4.8 To be able to synthesise knowledge gained from reading and studying scientific documentation.
	Learning skills: D5.1 To be able to independently extend the knowledge acquired during the course of study by reading and understanding scientific and technical documentation in English;
	D5.3 In the context of a problem solving activity, to be able to extend knowledge, even if incomplete, taking into account the final objective of the project;
	D5.4 To be able to formulate and validate theories and define new methods through empirical induction and new generation scientific investigation tools.
Assessment	The assessment is based on a final project that will be assigned during the semester. It will consist of solving a particular problem by using parallel computing techniques.
	The project will be developed by a group of two students (at most).
	Specifically, the team have to:
	 release the code by providing the instruction for result reproducibility; write a short scientific document describing the solution, the methodology, the technology they adopted for solving the problem;
	• prepare a short oral presentation of the project. After the presentation will follow a Q&A session to assess the knowledge of the candidate and its contribution to the project.
	The assessment is based on the individual contribution of each team member.
Assessment language	English
Assessment typology	Monocratic

Freie Universität Bozen Libera Università di Bolzano Università Liedia de Bulsan

Evaluation criteria and criteria for awarding marks	 The final mark is composed by evaluating the project in terms of originality of the methods adopted/designed, results obtained and quality and clarity of the presentation which includes code, document and oral presentation. Specifically, Code assessment (20% of the final mark). The software should follow the best practice for code writing. The experiments must be replicable. Document assessment (40% of the final mark). Ability to introduce a problem. Ability to report the state of the art. Ability to describe the methodology adopted. Ability to comment and report the results obtained. The originality and the soundness of the solution will be also considered in the evaluation. Quality and clarity of the oral presentation in a fixed time (40% of the final mark). Ability to answer to possible questions to the project and the related topics addressed during the course that can arise during the presentation.
--	---

Required readings	 There is not a single book that cover all the topics that will be presented during the course. Introduction to parallel computing 2nd edition (Grama, Karpis, Kumar, Gupta) Computer Architecture: a quantitative approach. 6th ed (Hennessy, Patterson) The Art of Multiprocessor Programming (Herlihy, Shavit) Programming Massively Parallel Processors: A Hands-on Approach 3rd Edition (Kirk, Hwu) Subject Librarian: David Gebhardi, <u>David.Gebhardi@unibz.it</u>
Supplementary readings	 CUDA C++ Best Practices Guide and CUDA C++ Programming Guide; C++ for OpenCL Programming Language; CUDA by examples (Sanders and Kandrot). Patterns for parallel programming (Timothy G. Mattson) Parallel Computer Architecture. A Hardware / Software Approach (David Culler)
Software used	Programming languages: C/C++ or Python. Compilers GCC and NVCC Other software/frameworks: CUDAToolkit, OpenMPI or OpenCL. Github.
