

Syllabus

Course description

Course title	Power Production, CHP and District Heating Systems
Course code	45510
Scientific sector	ING-IND/10 (Module 1) "Thermal Engineering and Industrial Energy Systems" ING-IND/08 (Module 2) "Fluid Machinery"
Degree	Master Energy Engineering
Semester	1
Year	2
Academic year	2022/2023
Credits	12
Modular	Yes

Total lecturing hours	36 + 36
Total lab and exercise hours	24 + 24
Attendance	Not mandatory
Recommended preliminary knowledge	Engineering Thermodynamics, Heat and Mass Transfer Fluid Machine Engineering
Connections with other courses	The courses "Engineering Thermodynamics, Heat and Mass Transfer" and "Fluid Machines Engineering", offered in the first semester, supply the main concepts of Engineering Thermodynamics and Fluid Machines. These topics are deepened in the Power Production, CHP and District Heating Systems course and specific and practical applications of power conversion systems are presented. The know-how acquired in the present course will be useful to follow the curricular courses "District Heating System Design" and "Bioenergy" and the elective course "Electric and hybrid mobility".
Course page	Course Offering / Free University of Bozen-Bolzano (unibz.it)

Specific educational objectives	<p>The Power Production, CHP and District Heating Systems course is a core teaching in the context of the Master in Energy Engineering and, specifically, it deals with the industrial plants used for electric and thermal power production both for small scale and community scale appliances. The course consists of two modules.</p> <p>The first module starts with the description of the main energy resources with particular focus on renewable sources. Then, fundamentals of energy conversion are presented, along with the working principles and the main operational aspects of the most used cogeneration plants</p>
--	---

	<p>both for large scale and for small scale distributed generation. Thermochemical processes in particular are analyzed by means of thermodynamic and kinetic approaches, as well as direct conversion technologies. Technical aspects of power generation systems and solutions to improve their energy and environmental performance are presented, dealing also with constructive aspects, plant operation and management issues and heat distribution networks.</p> <p>The second module introduces the fundamental concepts of cogenerations and presents the most used cogeneration solutions for civil and industrial applications. The working principles of the core devices of power production plants are presented. The main mechanical, fluid-dynamic and energy conservation principles and equations will be described and applied to the presented components of the power production plant. In particular, the following educational objectives will be addressed: constructive aspects, behavior of the fluid machines employed in power production plants, components, thermo-fluid-dynamic laws, evaluation of the plant performance in design and off-design operating conditions.</p>
--	---

Module 1	Thermal Power Production and Distribution
Lecturer	Prof. Marco Baratieri
Scientific sector of the lecturer	ING-IND/10
Teaching language	English
Office hours	Mondays to Thursdays, by appointment
Teaching assistant (if any)	Stefano Piazzì
Office hours	Appointment by email
List of topics covered	<p>The Thermal Power Production and Distribution module is intended to give the students the fundamentals of energy conversion processes from fossil or renewable sources to thermal power in centralized and distributed generation systems.</p> <p>The course will cover the following topics:</p> <ul style="list-style-type: none"> • Fuels and energy vectors • Fundamentals of thermochemical conversion • Fundamentals of direct conversion • Cogeneration and polygeneration systems • Thermal energy distribution
Professional applications of the covered topics	<p>The knowledge acquired through this module can be applied in the design and management of thermal plants and industrial energy systems. The related professional tasks are relevant in particular to traditional and innovative technologies for thermal power generation, e.g. combustion, gasification and pyrolysis. The competences can be deployed in private engineering companies, in</p>

	public agencies, in utilities' companies, as well as in the industry.
Teaching format	The course consists of lectures in which the topics are presented by the professor. There are also classes (exercises) that will give practical examples of the application of the theoretical topics. Course topics will be presented at the blackboard and using electronic slides. Teaching material and additional materials will be provided by the Professor during the semester.

Module 2	Thermal engines
Lecturer	Prof. Massimiliano Renzi
Scientific sector of the lecturer	ING-IND/08
Teaching language	English
Office hours	Appointment by email
Teaching assistant (if any)	-
Office hours	-
List of topics covered	<p>The Thermal Engine module is intended to give the students the design solutions for both large scale plants and small micro-cogeneration units for the local and distributed generation. The traditional fossil fuel feeding and the alternative or renewable energy feeding of the generation devices will be presented.</p> <p>The course will cover the following topics:</p> <ul style="list-style-type: none"> • Energy auditing and cogeneration indexes • Gas turbine plants design and microturbines • Internal combustion engine co-generators • Traditional and low temperature steam cycles • Combined cycles • External combustion thermal engine co-generators
Professional applications of the covered topics	The contents of this module will be useful for all the professional tasks, in the industry or in the public sector, related to the use of power plants and fluid machines in energy conversion process. Typical jobs can be the related to the design of cogeneration systems, boilers, fluid machines for power conversion (steam and gas turbines, combustion engines), management and control of power plants. These competences are necessary in the companies designing, managing and maintaining power plants, in utilities' companies and in the industries designing components and solutions for the power conversion.
Teaching format	This is a lecture course in which topics are presented by the Professor. Practical parts are explained by the Professor and the Teaching Assistants (if present). Power Point presentations will be given to the students in pdf format before each single lecture. Additional material will be provided by the Professor.

Learning outcomes	Intended Learning Outcomes (ILO)
--------------------------	---

	<p><u>Knowledge and understanding</u> Students should acquire the knowledge and the understanding of:</p> <ol style="list-style-type: none"> 1. the most important separate-generation and co-generation plant configurations for centralized or small and community scale power production, considering their energy and environmental performance 2. the fundamental plant components used in power production plants and their operative function 3. the fundamental design principles of the core components, their integration in a complex plant and the use of power plants in industrial and civil applications <p><u>Applying knowledge and understanding</u></p> <ol style="list-style-type: none"> 4. the ability to apply basic thermodynamic, kinetic and fluid-dynamic laws to the design of the components of power production plants 5. the ability to apply the studied power production plants to industrial and civil users <p><u>Making judgements</u></p> <ol style="list-style-type: none"> 6. to be able to make autonomous judgements in the choice of the design solutions, of the suitable machines and of the plant solutions in relation to their applications <p><u>Communication skills</u></p> <ol style="list-style-type: none"> 7. the ability to correctly and properly present the concepts acquired in the course both in written and oral form 8. the ability to use the proper technical terms to describe the design solutions of the power production plants. <p><u>Ability to learn</u></p> <ol style="list-style-type: none"> 9. the ability to acquire lifelong learning skills in the field of power production plants and cogeneration by applying the methods and the concepts acquired in the course
<p>Assessment</p>	<p>The student is asked to produce a project work on the design of an energy system (also integrating the topics of the other module of the course); this part of the assessment evaluates the ability of the student to apply the topics of the course in practical applications, the comprehension of the theoretical concepts and the ability to make judgments. The student is also asked to carry out an oral exam for</p>

each module of the course. The oral examination includes questions to assess the knowledge and understanding of the course topics and questions designed to assess the ability to transfer these skills to case studies of energy plants and thermal and electric energy production devices.

Formative assessment

Form	Length /duration	ILOs assessed
In class exercises	24 X 60 minutes	3,4,5

Summative assessment

Form	%	Length /duration	ILOs assessed
Oral exam – theory	70%	2 or 3 open-end questions per each module (1 hour)	1,2,3,4,5,7,8
Project work presentation	30%	Presentation and discussion (30 minutes)	4,5,6,7,8,9

Assessment language

English

Evaluation criteria and criteria for awarding marks

Students regularly enrolled at the 2nd year of the Master in Energy Engineering are eligible for the attendance of the lessons and the exam. Other exceptional cases have to be discussed with the Professor.

Oral exam – theory (open-end questions)

The oral exam on the theory assesses the knowledge and understanding of the course topics, the knowledge of the fundamentals of conversion technologies, of the operating principle and the design choices of energy production plants for community scale and small scale cogeneration, as well as the ability to transfer these skills to case studies and to make judgment. The following criteria will be taken into account:

- Correctness of the design choices
- Correctness of the dimensioning procedure
- Correctness of the numerical solution
- Appropriate use of measurement units
- Theoretical knowledge
- Ability to provide examples/applications of the theoretical concepts

Project work presentation

The following criteria will be taken into account:

	<ul style="list-style-type: none"> - Theoretical knowledge - Ability to provide examples/applications of the theoretical concepts - Communication skills and master of the technical language <p>The final mark will be weighted as follows: oral exam (70%, equally weighted for each module), project work presentation (30%). It will not be possible to pass the exam if the oral exam of both the modules has not been positively evaluated.</p>
