### Specific educational objectives
The course aims to introduce students to different aspects of solar energy. The course starts with an introduction to the properties of solar radiation. Fundamental properties such as energy content and spectral distribution and air mass will be defined. From there, the course explores the different strategies to harvest this vastly abundant source of energy. The topics covered range from the fundamentals and latest advances in photovoltaics to the thermal uses of solar energy such as solar heating and cooling as well as concentrated solar thermal power plants. The students will learn the fundamental principles and the system design indications of the each of the covered technologies.

### Lecturer
Dr. Morandi Federica

### Scientific sector of the lecturer

### Teaching language
English

### Office hours
t.b.d.

### Teaching assistant (if any)
none

### Office hours

### List of topics covered
- Solar energy
- Solar Radiation
- Photovoltaics
- Passive and Active Solar heating
- Solar thermal power plants
### Teaching format
Frontal lectures, exercises, seminar talks by the students.

### Learning outcomes
**Knowledge and understanding**
The students will learn:
- the fundamentals of solar radiation and the measuring techniques used to monitor these.
- The basic working principles of a photovoltaic (PV) cell, its limitations and concepts on how to possibly overcome these problems (3rd generation PV).
- system design for a PV plant, including shading considerations as well as tracking systems.
- special aspects of building and product integrated PV (BIPV and PIPV).
- the basic working principles of solar thermal collection and its different applications such as solar heating (passive vs. active), solar heat for industrial processes as well as solar cooling applications.
- the working principles of concentrating solar thermal power plants.
- how to estimate the efficiency for each of the covered systems as well as be introduced to different ways to simulate the respective systems.

**Applying knowledge and understanding**
Capability to implement the procedures and calculation methods presented in the course and to develop design and diagnostic skills.

**Making judgements**
Acquisition of critical assessment tools and critical evaluation of product specifications.

**Communication skills**
The student will be able to discuss the learned knowledge with vocabulary and technical terms of the discipline.

### Assessment
Oral examination with questions aimed at verifying the knowledge and the capability to understand the topics of the course and the mastery of the technical language. The capability to transfer these competences to applicative cases and the developed autonomy of judgment will be evaluated through the discussion of the design work assigned during the course.

### Assessment language
English

### Evaluation criteria and criteria for awarding marks
A single final vote will take into account of the knowledge of the course content (max 15 points), of the ability of applying the learnt topic (max 5 points), of the ability to synthesize information, correctness of the technical terms and clarity (max 5 points). With reference to the
developed design work, the capability to analyze the proposed problem and to formulate a cost-effective and technically advantageous solution will be taken into account (max 5 points).
