Title of research project: Poly-generation in biomass gasification systems in South-Tyrol

Description of the research activity: The present project aims to investigate the quantity, quality and environmental impact of the by-products of small-scale biomass gasification plants in South-Tyrol,

and to assess the possible routes for their valorization. A classification of these plants in the area of South Tyrol will be performed mainly by taking into account the by-products characteristics. Representative plants will be selected and monitored in order to support the analysis at the regional scale. In particular, it is foreseen the monitoring of the amounts of biomass and air fed into the gasifier, the production of thermal and electrical power, the producer gas composition, the gaseous emissions discharged by the energy generation stage and the amount of byproducts (char, ash and tar). Samples of the produced tar and char will be collected according to the technical specifications and characterized in laboratory. Valorization of the residues will be investigated as an alternative solution for reducing the management cost of the plants and increasing the exploitation of the resources in the view of a poly-generation concept. Two possible routes will be assessed: the utilization of char for energy production - either after post processing or through direct exploitation - and the utilization of char as raw material for innovative applications (e.g. as filtering medium).

Title of research project: Development of an "Intelligent Building Automation System" for optimization of energy consumptions and indoor environmental quality

Description of the research activity: The research assistant will participate in the IBAS project (Intelligent Building Automation System). The project is focused on monitoring activities of the indoor conditions in two classrooms at the unibz campus and on the implementation of active controls to

The collected data will be used firstly for diagnostic purposes (e.g., detection of energy inefficiencies, discomfort conditions) and then to develop correlations between occupants' behaviour and indoor conditions. In the next phase, the research assistant will add the necessary control devices to the existing systems and implement some active controls which will allow to adopt simple automation strategies and interventions to minimize the energy consumption and optimize comfort conditions (both visual and thermal ones). In the last part of the project, the research, with the support of the building physics research group at unibz, will implement advanced strategies of automatic control (i.e., Model Predictive Controls) based on the real time data measured by the FUB weather station and the results by dynamic simulation models of the classrooms.

Title of research project: Experimental analysis and modelling of liquid desiccant dehumidification to small-scale mechanical ventilation systems

Description of the research activity: The research assistant will investigate, through both modelling and experimental methods, the potential of dehumidification by means of liquid desiccant devices in mechanical ventilation systems, analysing the impact of different boundary conditions (climate and building use) and system configurations on both energy and economic performances. The research assistant will design a liquid desiccant system, as well as monitoring and control systems, to connect with the test rig for air heat recovery available at unibz building physics laboratory. The experiments will be performed in both steady and unsteady conditions to understand the performance dependency on air conditions, liquid properties and setup configuration. Starting from the experimental results as reference, both molecular dynamic and black-box models will be developed. The molecular-scale models will be used for the enhancement of the knowledge about the liquid desiccant – air – interface dynamics while the black-box ones will allow the performance characterization of the whole liquid desiccant system in a range of conditions wider than those assessed in laboratory. Correlations and findings from both models are expected to be used for the evaluation of the potential of both energy and economic savings in small-scale mechanical ventilation systems.
