"KAOS - Knowledge-Aware Operational Support"

Descrizione dell'attività / Beschreibung der Tätigkeit:

Analysis and development of components for the management of temporal data according to the OBDA approach, within the KAOS system. The candidate must develop new components for the Ontop system, which is based on the ontology-based data access (OBDA) paradigm. They must therefore have experience in developing complex Java applications, and also have a deep knowledge of the OBDA approach, both in terms of methodological and theoretical aspects, and in terms of implementation aspects. They must also use formalisms for querying temporal data (i.e., with a time-stamp attribute). In fact, these type of data play a crucial role in the KAOS project, in which techniques are developed for extracting information from process logs stored in relational tables:
