Competition Sector: 09/G1 (Systems and control engineering)

Area of research or title of the research project (+ acronym if necessary): Safety-enhancement in physical human-robot interaction

Research activity: There is enormous potential for robots that closely and physically interact and

collaborate with humans to boost economic productivity, product diversity and personalisation, to advance health and wellbeing for independent living, and to manage physical rehabilitation. These services, however, rely on developing new methods for human safety - specifically when looking at the continuous physical coupling of human and robot(s), either direct or through an object. Thus, a safety monitoring and energy shaping system to enhance human safety should be developed that goes beyond the current paradigm of impact-related injury reduction and intrinsically safe robots and enables robotic systems to operate safely in close and continuous physical interaction with humans. In doing so, general and modular models for all sub-systems (human, robot, object, contacts, environment) resulting in a free-parameterized model library as well as an energy monitoring system and safety-enhancing energy shaping controller should be developed. Further new physiologically-inspired safety metrics for continuous physical human-robot interaction should be defined and new standardisation procedures and tests for assessing human safety in continuous human-robot interaction should be developed.
